

Classes with Generics

DEBORAH A. TRYTTEN

CS 1324

Data Structures

- ▶ Ways of organizing data for efficient storage and retrieval
- ▶ ArrayList is our first data structure
 - ▶ Resizable array (special case of oversize array)
- ▶ Part of Java Collections Framework (JCF)
 - ▶ Library of Java data structures
 - ▶ API will look at bit odd at first
 - ▶ Uses advanced programming techniques
- ▶ There is a companion class of class methods
 - ▶ Collections

Why Do This Now?

- ▶ We can have more fun
 - ▶ With this class we can store large amounts of data
 - ▶ We can write programs more like the ones you really use
- ▶ Continue to improve OOP vocabulary
 - ▶ Class versus object
 - ▶ Class methods versus instance (object) methods
 - ▶ Parameters versus arguments
- ▶ Have a really amazing example of a mutable class

What is an ArrayList?

- ▶ A way of storing multiple objects in a sequence
- ▶ Objects are zero indexed
- ▶ No gaps permitted in sequence
- ▶ All of the objects must be the same type
 - ▶ Homogeneous
- ▶ Familiar properties hint at what's hidden inside

Construct an ArrayList

- ▶ Construct an ArrayList that stores String objects
- ▶ Read API
- ▶ What is <E>?
 - ▶ A variable that stands in for the type of data stored
 - ▶ We'll use String and wrapper classes
- ▶ Declare a reference
 - `ArrayList<String> list;`
- ▶ Construct an object
 - `list = new ArrayList<String>();`
- ▶ Draw memory diagram
 - ▶ list contains 10 null references
 - ▶ list does not contain any objects initially

Instant Quiz Question 1

- ▶ Which line of code below would construct an ArrayList that can store rainfall in inches?
- a) `ArrayList<Double> list = new ArrayList();`
- b) `ArrayList<double> list = new ArrayList<double>();`
- c) `ArrayList<double> list = new ArrayList();`
- d) `ArrayList<Double> list = new ArrayList<Double>();`
- e) `ArrayList<Double> list;`

Capacity and Size

- ▶ ArrayList objects are given an initial capacity of 10 by default constructor
 - ▶ This is the number of objects that can be stored without resizing
- ▶ There is another constructor that lets you control the initial capacity
 - ▶ Use it if you know capacity in advance
- ▶ An ArrayList object initially has a size of 0
 - ▶ No objects are stored in it
- ▶ As objects are added the ArrayList object increases its size
- ▶ Capacity is automatically increased as necessary behind the scenes (encapsulated)

Instant Quiz Question 2

- ▶ Suppose that we created an `ArrayList<Integer>` object and have added three `Integer` objects (1, 3, and 5)
- ▶ Which of the following is true?
- ▶ a) Size is 3 and capacity is 10
- ▶ b) Size is 3 and capacity is 3
- ▶ c) Size is 10 and capacity is 3
- ▶ d) Size is 10 and capacity is 10

Shopping List: Add items

- ▶ Look for method in API
 - ▶ Accessor or mutator?
- ▶ Add items at end of list
- ▶ Add items at start of list
- ▶ Show memory diagram
- ▶ Where are we allowed to put items?
 - ▶ Read API for `add(int index, E Element)`

Shopping List: Display Items

- ▶ Use toString()
- ▶ How to access individual elements?
- ▶ How many elements are in the list?
- ▶ What control structure should we use?
- ▶ Write code to display all elements in this format
 - ▶ 1. First item
 - ▶ 2. Second item
 - ▶ ...

Shopping List: Delete Items

- ▶ By item number
 - ▶ How to avoid leaving gaps
- ▶ By name
- ▶ All items
 - ▶ Two ways

Collections Class

- ▶ Similarity to Arrays
- ▶ Contains only static methods
 - ▶ Some really crazy syntax
 - ▶ Use common sense
- ▶ ArrayList objects are passed by sharing
 - ▶ Exactly like arrays
- ▶ If new ArrayList is constructed inside method it must be returned

Collections Rules

- ▶ ArrayList can be arguments for any parameter that asks for
 - ▶ Collection
 - ▶ List
- ▶ Any method that returns a Collection or List may be stored in an ArrayList
- ▶ Methods that need to do < only work on objects that have compareTo() methods
 - ▶ String, Integer, Double, Character, other wrappers
 - ▶ What would it mean to sort Point objects?

Lots of Great Methods

`sort()`

`copy()`

`disjoint()`

`fill()`

`frequency()`

`max()`

`min()`

`reverse()`

- Print the shoppingList in sorted order

Instant Quiz Question 3

- ▶ Suppose the Collections class had a method that performed linear search for a target value. What would the signature be?
 - a) `boolean contains()`
 - b) `boolean contains(E target)`
 - c) `boolean contains(ArrayList<E> list, E target)`
 - d) `boolean contains (ArrayList<E> list)`
 - e) `void contains (ArrayList<E> list, E target, boolean islnThere)`

Using Wrapper Classes

- ▶ Suppose that we're storing examination scores
 - ▶ `ArrayList<Integer> scores;`
- ▶ Add the scores 90 to 99 to the `ArrayList` object
 - ▶ Add 93 four times
- ▶ Play with some `Collections` methods
 - ▶ Find the maximum
 - ▶ Find how many times 93 occurred
 - ▶ Shuffle the list

Binary Search

- ▶ Same as in Arrays class
- ▶ Requires sorted data
 - ▶ If not sorted the results are undefined
- ▶ Analogy to dictionary
- ▶ Algorithm same as for arrays
- ▶ Very, very fast when compared to linear search

Instant Quiz Question 4

- Suppose we execute the following code

```
ArrayList<Integer> list = new ArrayList<Integer>();
```

```
for (int i=15; i>0; --i)
```

```
    list.add(new Integer(i)); // read carefully
```

```
int index = Collections.binarySearch(list,  
    new Integer(2));
```

Which of the following is true:

- a) The index will be positive
- b) The index will be zero
- c) The index will be negative
- d) The index will be meaningless

Autoboxing

- ▶ Java knows the relationship between primitive data types and wrapper classes
 - ▶ If you insert a primitive data type instead of an object Java constructs the object automatically
- ▶ Rework the example from the last slide with int instead of Integer
 - ▶ Remember that objects are being constructed
- ▶ Similarity to hidden String constructor

ArrayList and Mutable Objects

- ▶ ArrayLists and mutable objects can cause trouble
- ▶ Create ArrayList of StringBuilder objects
 - ▶ Sort it
 - ▶ Save the reference to the second object
 - ▶ Change it
 - ▶ What happens to the object in the ArrayList?
- ▶ Show memory diagram
- ▶ Try sorting and binary search
- ▶ Why would JCF work this way?
- ▶ Note Java strongly prefers immutable objects
 - ▶ Avoids subtle debugging problems
